

College Of Engineering & Technology

The college aims to ensure that through the consistent provision of high quality programmes and services which enhance competence and contribute to the achievement of personal and organizational excellence. The college seeks to enable graduates to gain a competitive edge in pursuing technical, managerial and professional careers and to make an outstanding contribution to the performance of their employing organizations. Various programmes are offered, which are designed to meet the needs of students in today's global job market.

Engineering is a practical subject and project work forms a major part of all the degrees offered along with the unique viva sessions. All undergraduates undertake group design and business projects, which develop the essential managerial, and team-working skills needed by tomorrow's engineers.

Professional Orientation

The undergraduate courses are designed to equip you with the professional skills required by industry. Significant parts of the degree schemes are taught in liaison with the industrial partners, who frequently offer lectures, site visits, prizes etc.

This, together with the fact that maximum of the students spend a full year on placement in industry, means that the graduates are particularly well placed in the employment market.

Professional Approach

The undergraduate laboratories contain modern equipment, and up-to-date and challenging laboratory programmes in the first two years form one of the strong features of the degree courses. Computing laboratory provides dedicated and networked computer facilities for students to carry out general IT, simulation and computer aided design work.

Problem solving classes are a feature of most taught modules and remain firmly committed to the small group personal tutorial system. Your tutor will help you with any difficulties as well as providing encouragement and pastoral support.

Career opportunities & Placement

Here the courses develop the professional skills and maturity that are highly valued by employers world-wide in many key areas such as developing new products, designing new processes, and optimizing the performance of existing ones. In addition engineering graduates can be involved in research, process development, plant management, economic analysis, safety, pollution prevention and control often at the most senior levels. Students are placed in the top companies like Infosys, Microsoft, IBM, WIPRO, FORD, US-technology, TCS, L&T, CTS, HCL, Hyundai, Nokia and many more.
