CUSTOMIZED TREATMENT IN CANCER TO KEEP CANCER FROM RETURNING

CANCER RELAPSE

You have just had surgery, radiation and chemotherapy, but how sure are you that your cancer won't return? A cancer recurrence occurs because in spite of the best efforts to get rid of cancer, some cancer cells are left behind. These cancer cells may remain dormant for a period of time, but eventually they continue to multiply resulting in the recurrence or relapse.

Cancer can often be successfully treated by surgical resection, chemotherapy or radiation. However these therapies are mostly ineffective in controlling the micro-metastasis. Micro-metastases are single tumor cells or clusters of cells shed by solid cancers and disseminated in various organs of the body. Micro-metastases, i.e. tumor cell dissemination have a pronounced clinical effect, are hard to detect and can be the starting point of recurrence of cancer.

Numerous evidences indicate that for cancer to occur the immune system must have failed. The uninterrupted growth of cancer cells results from inappropriate surveillance and control of the immune response. Dendritic cells are highly specialized cells of the immune system which help in the recognition of cancer cell and assist in its killing. Dendritic cell therapy helps in correcting the failed immune surveillance and teaches the immune system to recognize and kill cancer cells. DC therapy targets micro-metastasis and destroys the disseminated cancer cells, thereby preventing its development, slowing the spread of cancer and improving the life expectancy.

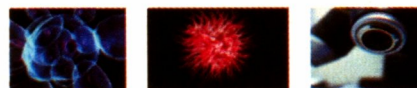

The Institute of Cellular Therapies (ICT) is the first and only to offer Dendritic cell therapy (DENVAX™) in India. DENVAX™ is customized treatment of solid cancers in various stages of disease. However, it works best in remission phase to prevent relapses and recurrences, the major cause of morbidity and mortality in cancer. Designed to be specific it targets only the cancer cells without harming the healthy ones. Our experience of three years in clinical practice involves administering DENVAX™ to numerous patients suffering from various solid cancers and Non Hodgkin's Lymphoma and Multiple Myeloma. The results range from delay in disease progression to complete remission. The treatment is helping several patients lead a good quality life. At the ICT, each treatment plan and each dendritic cell therapy dose (DENVAX™) is customized to the person living with cancer to help them overcome their disease.
