Take on this realty tour and fall in love with India's ancient heritage and... find out how much has Independent India progressed in the realty sector in recent years.

WAY AHEAD

CHICHEN ITZA

This famous Mayan Temple City is demonstrative of an extraordinary commitment to architectural space and composition.

Builders like DLF, Ansal API and Meriton Group are coming up with avant-garde design models and formats. With such out-of-the-box approach to modern architecture, Indian construction industry is all set to give stiff competition to international players.

Do we call it architectural renaissance? Perhaps yes. Modern innovations seem to be redefining building and construction concepts in India currently. A welcome way to bring our realty sector at par with global standards, this product differentiation will certainly bring a new wave of growth. Thanks to players like DLF, Ansal API and Meriton Group.

These architectural players are creating history by delivering the finest infrastructure to the country. Let's start with the Meriton Group which is going to build its first up-market housing project, Orange County, in Indirapuram which will have a reversed clubhouse which when looked from outside will give the illusion of an inverted structure and from inside it will look like any other clubhouse. It will have facilities of the very best kind.

DLF's has already made a lot of contributions to the infrastructural growth of the nation and now it has come up with its unique architectural design. It is a ship-shaped Gateway Towers in Gurgaon, a 12-storey complex. A DLF official says, "Product differentiation is very important as a developer has to cater to all classes of the society. These projects are very different from other projects in all aspects - architecture, quality and developmental mix - and are targeted towards the niche segment."

Another design which is likely to create history is the EON Zone in Pune. It is an extra-ordinarily designed four-leaf structure. It is spread over 45 acres of land, using minimal design and representing offbeat architectural design in its entirety. It is named the four-leaf structure as this IT and ITes Special Economic Zone (SEZ) has placed four clusters like four-leaf clovers along with a residential block.

The elements which make the realtors to take such high-end risks by launching such out of the ordinary projects are - increasing customer expectations, exposure to international trends and growing competitiveness in the sector. "Customers demand something that is world-class and are well updated about international living standards. Branding is the key and can be an excellent strategy in such a scenario," says Kunal Banerji, president (marketing) of Ansal API.

The scope for experimentation is much more in the commercial segment than the residential segment. Same goes while choosing a corporate location, the exterior appearance is side-lined with other consequential measures like floor plate designs, building services and energy conservation.

In times ahead, undoubtedly the out-of-the-box concepts would be welcomed. Buildings with unconventional appearance and unique facilities will be preferred over the million other similar looking structures. Well, this is the way to be at par with the global criterion.
