

■ By Raj Chengappa in Greenland

It's blinding white and there is no way of telling where the vast sheet of ice ends and the strips of clouds in the distant horizon begin. The thin haze and the ethereal light of the sun slanting down from an iridescent blue sky give you a vision of what Heaven would probably look like. I am standing on top of the planet and Thomas Friedman, *The New York Times* columnist and one of my travelling companions on this trip, must have noticed that from this vantage point there is no arguing that the world is truly flat. Peeling back layers of clothing I check the time on my watch. It's 12.47 a.m. but then Greenland is the land of the midnight sun in summer. There is no night as we know it in India. Just a dull brightness which makes going to sleep extremely difficult and the reason why I am trudging on the ski-way of a remote research ice station at this unearthly hour. "It's probably the nearest experience to walking on the moon," Connie Hedegaard, Denmark's sprightly minister for climate and energy

HANNA LUDWIGSON
