

Open up tomorrow today - TOYOTA

Toyota's commitment to the future

Toyota aims to realize a tomorrow where people, society and the earth, can co-exist in harmony. To this end, it is constantly working towards optimizing the energies of people and technology, through its array of world-class cars.

In India, we believe there are two factors crucial to making us an integral part of a sustainable society. One is 'Growing together with the Indian Society'. The other is 'Developing People'. In other words, we hope to help the industrial development of India, while contributing to increasing employment opportunities. We are conducting several activities that guarantee further localization, such as introduction of the Toyota manufacturing system, various technology transfers and development of the parts industry.

In Bangalore, Toyota has set up the Toyota Technical Training Institute (TTTI) for line-technicians to effectively train our human resources. Further, the Toyota Technical Education Program has been implemented across the country to provide specialized training to the service staff.

Toyota aims to cater to the diverse and growing needs of consumers, by creating cars that let them enjoy all the benefits and pleasures of motoring. Since the release of the Qualis in 2000, the Innova and Corolla have been sold as local production models. Now, we are examining how to introduce future products into the core segment of India's future motorization development.

We also understand that the increasing number of cars on the road is not necessarily a good thing for the environment. At Toyota, our response will be to create cars that are good for both the people and the environment, in order to realize a sustainable automotive society.

The environment is a growing concern and deserves thoughtful attention, not just from us as corporations, but from all of you as citizens of the planet. At Toyota, we strongly believe that a sustainable future is achievable if we focus on 'Acting Today'. Therefore we urge each of you to join this movement, and do your bit for your country, as much as for the earth. Together, let us turn this vision of a green and happy tomorrow, into a global reality, today.

Towards Sustainability

At Toyota, we aim to fulfill our social responsibility by focusing on three key areas of sustainability- research & development, manufacturing and social contribution. By implementing activities that support these three areas, we consistently unify people, society and the earth, to create a sustainable automotive future.

Sustainability through Research & Development

Technology

Toyota's prime initiative towards a sustainable future lies in technological innovation. For this purpose, we do extensive research and development in our core business area - mobility technology - while considering infrastructure, people and mobility, as a unified whole. In other words, we aim to

create cars that produce clean air. Cars that assure absolute safety. Cars, that more and more people love to drive.

Hybrids

Hybrids are clearly, cars of the future. At Toyota, hybrid technologies are expected to play a major role in boosting line-ups. We are steadily working towards creating the ideal eco-car, through ongoing research and development in powertrain technologies.

In 1997, Toyota released the Prius, the world's first mass-produced hybrid car, and one of the most fuel efficient gasoline 5-seater passenger cars around the globe.

A recent hybrid, the Toyota FCHV (Fuel Cell Hybrid Vehicle), is considered to be the closest thing yet to the ultimate eco-car. The fuel cell makes electricity by combining hydrogen and oxygen in a chemical reaction like a miniature power plant. This direct generation makes it eco-friendly and highly efficient. Currently available in limited quantities in Japan and the US, Toyota is working to make the FCHV everyone's car in the near future.
