

Sustainability through Social Contribution

Social Contribution

Since its inception, Toyota's business activities have followed the principle of "contributing to the development of a prosperous society through the manufacture of automobiles." Apart from automobiles, Toyota is also engaged in extending its contribution to a host of other vital social issues. For the environment, it is organizing conservation activities and afforestation programs globally. For traffic safety, it is making positive efforts towards supporting and educating people about the significance of road safety. Altogether, Toyota's portfolio of social activities aims to steadily head towards sustainable development of people, communities, and the planet as a whole.

IN INDIA:

Toyota is working towards social upliftment in India through a host of initiatives by concentrating on two chief areas of development – environment and safety. TKM at Bangalore has adopted the

'Growing Together' philosophy of Toyota, in collaboration with its dealers and suppliers. This philosophy is targeted at achieving long-term business growth, while working for the good of society. In order to support community development programs, it has partnered with several organizations,

schools, universities, and other businesses. Some of Toyota's other initiatives include education through a residential school, imparting technical know-how to students who cannot pursue further studies, and providing safety education through the Toyota Safety Education Program (TSEP).

In 2007, Toyota celebrated its 70th anniversary. In recent years, the situation surrounding corporations has changed dramatically. One of the greatest changes is the increasing demand for Corporate Social Responsibility to take on global environmental issues such as global warming, resource depletion and atmospheric pollution.

Faced with these issues, Toyota considered what responsibilities we can undertake and concluded that the answer lies in the Toyoda Precepts, the counsel put forth by Sakichi Toyoda that has been passed down since Toyota was first founded. The Toyoda Precepts are, if you will, the DNA inherited by the Toyota

Group. They say in part, that one should contribute to the betterment of the earth and society in a concrete way by always remembering to be thankful, and through innovative technologies.

In order to make tangible progress in initiatives that contribute to sustainable development of the environment and society in the future, Toyota is putting forward the "sustainability in three areas" concept, which encompasses research and development, manufacturing, and social contribution. Based on this theme, we are advocating activities that target harmony between people, society and the earth.

Katsuaki Watanabe,
President
Toyota Motor Corporation
